

Alessandra Crispini is Full Professor of inorganic and structural chemistry at the University of Calabria since 2012. Her research activity is focused on molecular structure determination of inorganic and coordination compounds using single-crystal and powder X-ray diffraction techniques, as part of the study of their structure-property relationship. In particular, her two main investigation fields are: (a) structural characterization of mesogenic (in particular metal containing liquid crystals) and luminescent materials; (b) structural characterization of new inorganic compounds of biological and pharmaceutical interest containing organic ligands of natural extraction. She has published more than 130 papers in international peer-reviewed scientific journals.
